

From an "A" size sample cut the shape according to the drawing. Repeat the process with about 20 - 25 similar pieces with the same or different texture.

Put the pieces on top of each other rotating each piece 90 degree from the one below.

The first two pieces of the pot will be squares having 21 cm each side.

Insert four nails in the corners as in the drawing from the bottom to the top, having them clinched after that.

Put soil in the middle and a plant ant that's it!

The pot you have will hold water for much longer than others!

Similar to this method you can try various sizes depending on how big the plant will be.
